

ABSTRACT

An anti-virus usage model for a computing device includes a secondary display on an exterior panel of the computer device and a plurality of user buttons adjacent to the secondary display. The computing device may also include a virus indicator button on the exterior panel. The secondary display presents virus information of the computing device, and the user buttons receive commands from a user to perform anti-virus operations. The virus indicator button is integrated with a light-emitting diode (LED) to display different colors indicating different virus statuses. Thus, anti-virus information may be easily accessible and anti-virus operations may be easily performed.
